

FITTING INSTRUCTIONS

AP2006S - Side Hinged Door Operating Arm upgrade kit for use with Seip TS75

For the automation of a pair of traditional outward opening side hinged barn type garage doors

The AP2006 kit suits overall opening widths up to 3mtrs (kits are also available for openings from 3.1mtrs to 4.6mtrs)

For use with a Seip TS75 garage door operator

The Seip TS75 has a very sophisticated self learning safety stop system to provide the high level of protection required on side hinged doors and also incorporates a safety stop logic reversal switch for outward opening doors to avoid the need for special modification when used on this type of door

1. Close the doors and check that the lapping edges are not jamming and that the doors are closing properly at the bottom.
2. Assemble the Seip TS75 electric operator according to the manufacturers instructions and Set DIP switch No.6 on the P.C.B. to the "ON" position. *(this will reverse the TS75's logic system to suit barn doors so that the motor's safety reverse system function correctly during door closure)*
3. Remove the manual release cable, the "L" connecting arm (the hockey stick shaped bracket) and door bracket from the Seip TS75
4. Fix the door header track bracket 20mm above the bottom edge and centrally on the rear face of the door frame header.
5. Install the electric operator keeping the track horizontal and fit the motor support brackets.
6. Lay the AP2006 door arms on the floor, and fit the Seip "L" arm *(the hockey stick shaped arm)* to the AP2006 arms as shown in the illustrations below using the M8 bolts & washers provided.
(the arm with the longer sliding travel will be attached to the door that is rebated to close first)
7. **Important:** the bolt attaching the hockey stick bracket to the main arm should be fitted with a nyloc nut & wavey washer and tightened so as to allow the bolt to rotate and thus function as a pivot point to allow the two arms to swing apart freely.

Arms shown configured for RH leaf to close first (when viewed from inside)

Arms shown configured for LH leaf to close first (when viewed from inside)

8. Make a pencil mark at the top of both doors 1 mtr. from the hinged edge.
9. **Important:** Check that the M8 locking nut on the swivel bracket at the end on the arms is secure but not too tight because **it is essential that swivel bracket can rotate freely by hand**
10. Attach the swivel bracket to the sliding trolley of the electric operator
11. Fix the other ends of arms to the doors at the 1 mtr. pencil mark using 8mm x 40mm coach screws.
Hint: use a strap to support one arm while attaching the other arm to the door.
12. Lubricate all moving & sliding parts with oil. (engine oil recommended)

Engage and carefully run the electric operator and set the open & close limit stop adjustments, use the "open" limit adjustment to set the desired stop position when fully open, the "close" limit adjustment should be set to stop the motor when the doors have closed and extended the sprung loaded door arms.

(note:- the "OPEN" and "CLOSE" markings on the white cog wheel will be reversed as a result of DIP switch No.6 being altered)

Notes:

- a/ Check the safety-stop system and make adjustments to the trip sensitivity if required, the motor must reverse if the doors are obstructed while closing (see step 2.)
- b/ If no alternative access is available a cable operated external release device should be fitted to enable manual operation in the event of power failure.
- c/ All moving parts should be lubricated annually (engine oil recommended)
- d/ To prevent loss & damage from forced entry our Securi-Dor bottom locking kit model AP2007 Mk2 can be fitted to automatically secure the doors at the bottom when closed.
- e/ **Important:** the fixing bolts on the AP2006 arms should be checked regularly for correct tightness *(as detailed in steps 7 & 9 above)*

For Securi-Dor bottom locking use our optional Securi-Dor AP2007 Automatic Bottom Locking Upgrade
